Outline

- Steady-state convection-diffusion-reaction equation

$$\begin{aligned} -\varepsilon\Delta u + \mathbf{b}\cdot\nabla u + cu &= f \quad \text{in } \Omega, \\ u &= u_b \quad \text{on } \Gamma_{\mathrm{D}}, \\ -\varepsilon\nabla u\cdot\mathbf{n} &= g \quad \text{on } \Gamma_{\mathrm{N}} \end{aligned}$$

  - Ω – bounded polyhedral Lipschitz domain in $\mathbb{R}^d$, $d \in \{2,3\}$
  - $\mathbf{n}$ – outward pointing unit normal
  - Assume

$$\left(c(x) - \frac{1}{2}\nabla\cdot\mathbf{b}(x)\right) \geq \sigma > 0$$

  - Interested in convection-dominated regime, $\varepsilon \ll \|\mathbf{b}\|_{L^\infty(\Omega)} L$
  - L – Characteristic length of the problem

Lemma

Let $\mathcal{T}$ be a non-conforming triangulation of Ω, i.e., $\mathcal{T}$ has hanging nodes. Then, for all $q \in H(\mathcal{T})$ there are coefficients a_{qp} with $p \in N_F(\mathcal{T}) \setminus H(\mathcal{T})$ such that all $v \in V_h$ can be represented as[1,2]

$$v(q) = \sum_{p \in N_F(\mathcal{T}) \setminus H(\mathcal{T})} a_{qp} v(p)$$

Theorem

Let $\{\mathcal{T}_0, \cdots, \mathcal{T}_j\}$ be a grid hierarchy on Ω with $\mathcal{T}_0$ being conforming. Let us denote $\mathcal{T} = \mathcal{T}_j$, i.e., the final refinement level. Then a basis of V_h is given by[1]

$$B(\mathcal{T}) := \left\{ \varphi_p = \varphi_p^{\mathrm{nc}} + \sum_{q \in H(\mathcal{T})} a_{qp} \varphi_q^{\mathrm{nc}} : p \in N_F(\mathcal{T}) \setminus H(\mathcal{T}) \right\}$$

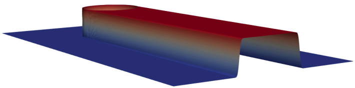
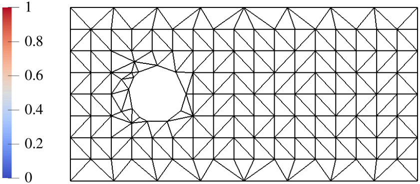
- Hemker problem[1]
- $\varepsilon = 10^{-4}$, $\mathbf{b} = (1,0)^T$, $c = f = 0$





- stop of the non linear iteration
  - 10000 iterations
  - $\|\text{residual}\|_2 \leq \sqrt{\#\text{dof}}\,10^{-8}$

- Conclusions[1]
  - Accuracy of solution
    - AFC + BJK limiter and MUAS method converge on all grids
    - AFC + Kuzmin limiter does not converge on adaptively refined grids if solution becomes (locally) diffusion-dominated
